Image Captioning Project Report

This project implements an Image Captioning system using two architectures:

1. A CNN–LSTM model where the CNN extracts image features and the LSTM generates captions.

2. A BLIP (Bootstrapping Language-Image Pre-training) transformer-based model for more advanced caption generation.

The system includes:

- Image preprocessing

- Feature extraction

- Caption generation

- Flask web application for image upload and caption display

This PDF summarizes the overall structure of the project for submission.
